Introduction

Literature
survey

Proposed
System

Architecture

System Design

Algorithms

Advantages

- Data mining technology has been developed with the goal of providing tools for automatically and intelligently transforming large amount of data in knowledge relevant to users.
- knowledge discovery process, however, can also return sensitive information about individuals, compromising the individuals right to privacy.
- For this reason, several data mining techniques, incorporating privacy protection mechanisms, have been developed based on different approaches.

Proposed
System

Architecture

System Design

Algorithms

Advantages

- The typical additive reconstruction technique is column-based additive randomization.
- This type of techniques relies on the facts that column-based value distortion can be applied to reconstruct some sensitive columns.
- Some existing techniques addresses the problem of building a decision tree classifier in which the values of individual records have been perturbed using randomization method.

System Design

Algorithms

Advantages

- The proposed approach, aim to achieved better result for privacy on database than existing system.
- Proposed algorithm perturbs the data by normalization, average and multiplying a noise.
- The Proposed approach uses value distortion method for data perturbation.

1.Algorithm

Initialize variable $i, j, \text{mean}, \text{count}=0, n, \text{value}$

For value of $i=1$ to 10

Normalized Value= $\text{mean}-i/i$

$i=i+\text{Normalized value}$

end for

count++

Check if ($\text{count}==1$) Then

average= $\text{average}(i)$

For value of $j=1$ to n

value= $i*j$

perturbed Data= $\text{Value}+\text{Sensitive attribute}$

end for

Check if($\text{count}==1$) Then

reset $i=1$

end

Algorithms

Advantages

- Provide summary statistical information without disclosing individuals confidential data.
- Data loss will be minimized.
- The proposed mechanism will give high performances and low error rate compared with existing methods.

System Design

Algorithms

Advantages

- Proposed approach focused on data perturbation by randomization noise addition to preserve privacy of sensitive attributes. Proposed approach tried to keep statistical relationship among the tuple attributes intact. We can predict that Results show fairly good level of privacy with reasonable accuracy in almost all test cases. Privacy of original data after applying perturbation has been quantified using misclassification error.
